EDUCATION

Yaşar University

Sep 2024 – Jun 2028 (expected)

B.Sc. in Software Engineering • **GPA: 3.48/4.00**

PROJECTS

Senior Project Management Platform | SE3318 course github.com/SE3318-Spring-2025-2026/senior-app-1
~10-person team • Platform for team formation, advisor matching, submissions, sprint tracking and grading

- Worked full-stack: built REST APIs in Node.js and connected them to the React front end.
- Rewrote the authentication and authorization system so each user role can access only its own data.
- Integrated JIRA tasks and GitHub activity into a PostgreSQL database via APIs, so advisors no longer collect progress by hand.
- Ran the AI checks on a free local Ollama model, switchable to Claude with a single setting.
- Produced most of the data flow diagrams and technical documentation.

RSVP Reader | Personal project

github.com/HawkOsm/rsvp-reader

Cross-platform speed-reading app that shows books and documents one word at a time

- Designed it like Discord: a single codebase ships web, desktop (Windows, macOS, Linux) and mobile (Android) versions, with no separate development per platform.
- Set up builds and releases for every platform; user data is stored in a local on-device database.

Kaggriculture | Kaggle AI competition

github.com/HawkOsm/Kaggriculture

Autonomous AI agent that runs a virtual farm and competes against other teams' agents

- Built the agent from scratch in Python to make its own production, resource and sales decisions; improved its performance through automated optimization.
- Experimented with machine learning and reinforcement learning approaches and compared the results with data.
- Built an evaluation system that tests every new version against opponents in simulation (A/B testing).

EXPERIENCE

Software Engineer | Anafarta UAV Team, Yaşar University

Dec 2025 – Aug 2026

Software for the kamikaze (autonomous target dive) mission in Türkiye's national Combat UAV competition

- The team advanced from **1,032** applicants across **10 countries** to the **42 finalists**, completing **13 flight stages** in harsh weather and placing **17th**.
- Ran a YOLO computer vision model on the onboard NVIDIA Jetson to detect a 2×2 m QR target on the ground, and designed a Python algorithm that steers the aircraft to the target in real time.
- Tested the kamikaze algorithm in simulated flights in Gazebo, then executed it successfully on the real UAV.

Software Engineering Intern | CLB Automation (remote)

Jan 2025 – Oct 2025

- Developed a computer vision model (OpenCV, YOLO) that detects defects in an iron press machine's output, using its camera footage as training data.
- Delivered it to the company as working prototypes that alert the operator when a defect is detected.

SKILLS & LANGUAGES

Technical: JavaScript / TypeScript, Node.js, React, Python, Java, C, C++, Bash; PostgreSQL, SQL, Supabase; REST API; Git, GitHub, JIRA, Scrum; Docker, Linux; OpenCV, YOLO, ArduPilot, NVIDIA Jetson, Raspberry Pi; Claude Code, Ollama

Languages: English (fluent), Turkish (native), Japanese (beginner)

CERTIFICATES

TEKNOFEST 2026 Combat UAV Competition | T3 Foundation

Sep 2026

EFES-2026 Defense Project Competition | Yaşar University, Rector's Office letter

Jun 2026
